Lake Luzerne

Survey Date: July 30, 2018

Lake Description

Lake Luzerne is 103.71 acres. It is located in the town of Lake Luzerne, Warren County and lies in the Upper Hudson watershed. The team launched at the ramp on Lake Avenue with special permission from the town supervisor.

Aquatic Invasive Plant Presence

There is active invasive *Myriophyllum spicatum* (Eurasian watermilfoil) management on Lake Luzerne. At the time of survey, the management team was removing *Myriophyllum spicatum* from the lake, near the southern shore. Nineteen beds of *Myriophyllum spicatum* were detected. Beds ranged in size from 159.9 square feet to 6,559 square feet and were moderately dense. *Potamogeton crispus* (curly-leaf pondweed) is another known invasive species in Lake Luzerne, though none was detected during this survey. *Potamogeton crispus* has a unique biology that may factor into detection. It is usually one of the first plants to emerge each spring, and by mid-June or July the plants typically have died off for the season.

Native Plant Biota

Comprehensive surveys of all native plants found within the pond were not prioritized in 2018, as this data had been previously collected in 2015 when the lake was first surveyed. Native species detected in Lake Luzerne were: *Potamogeton amplifolius* (large leaf pondweed), *Brasenia schreberi* (watershield), *Utricularia intermedia* (flat-leaf bladderwort), *Elodea canadensis* (common waterweed), *Potamogeton robbinsii* (fern pondweed), *Najas* spp. (naiad), *Nitella* spp., *Myriophyllum sibiricum* (northern watermilfoil), and *Potamogeton gramineus* (variable pondweed).

Aquatic Invasive Animal Presence

Sediment sieves were taken to determine the presence of *Corbicula fluminea* (Asian clams). None were found. Three plankton tows were also conducted with no invasive plankton detected.
